## Setup

Load data and select columns used in model. See data/exp2\_data\_about.txt for more details.

```
d <- read.csv("../data/exp2_data.csv", stringsAsFactors=TRUE) %>%
  rename("Participant"="SubjID", "Item"="NameShown") %>%
  select(Participant, SubjGender, Condition, GenderRating, Item,
         Male, Female, Other)

str(d)
```

```
## 'data.frame':   9457 obs. of  8 variables:
## $ Participant : Factor w/ 1351 levels "R_06Tps0XX28Fe09j",...: 694 694 694 694 694 694 694 301 301 301 ...
## $ SubjGender  : Factor w/ 5 levels "female","genderqueer",...: 3 3 3 3 3 3 3 1 1 1 ...
## $ Condition   : Factor w/ 3 levels "first","full",...: 1 1 1 1 1 1 1 1 1 1 ...
## $ GenderRating: num  5.59 4.22 2.12 6.73 3.61 4.73 1.21 6.24 4.39 2.61 ...
## $ Item        : Factor w/ 105 levels "Ashley","Ashley Cook",...: 51 91 18 60 87 55 63 1 47 29 ...
```

```
## $ Male      : int  1 1 0 1 1 0 1 0 0 1 ...
## $ Female    : int  0 0 1 0 0 1 0 1 1 0 ...
## $ Other     : int  0 0 0 0 0 0 0 0 0 0 ...
```

Center gender rating for names: Original scale from 1 to 7, with 1 as most masculine and 7 as most feminine. Mean-centered with higher still as more feminine.

```
d %>% mutate(GenderRatingCentered=scale(d$GenderRating, scale=FALSE))
```

Set contrasts for name conditions.

```
contrasts(d$Condition) = cbind("last vs first/full"=c(.33,.33,-0.66),
                               "first vs full"=c(-.5,.5,0))
contrasts(d$Condition)
```

```
##      last vs first/full first vs full
## first          0.33          -0.5
## full           0.33           0.5
## last          -0.66           0.0
```

Subset for gender rating effects (First and Full conditions only).

```
d.FF <- d %>% filter(Condition!="last")
d.FF$Condition <- droplevels(d.FF$Condition)
contrasts(d.FF$Condition) = cbind("first vs full"=c(-.5,.5)) #add contrast back
contrasts(d.FF$Condition)
```

```
##      first vs full
## first          -0.5
## full           0.5
```

## Without OTHER responses

The first supplementary analysis tests if excluding OTHER responses (4.15% of total responses) affects the pattern of results.

```
o <- sum(d$Other)
o
```

```
## [1] 392
```

```
o/length(d$Other)
```

```
## [1] 0.04145078
```

Exclude OTHER responses.

```
d.noOther <- d %>% filter(Other==0)

d.FF.noOther <- d.FF %>% filter(Other==0)
```

## Model 1: Condition w/o OTHER

Effect of Name Condition (first name, last name, full name) on likelihood of a FEMALE response, as opposed to a MALE response, with OTHER responses excluded. Participant and Item are again included as random intercepts, with items defined as the unique first, last and first + last name combinations.

```
m.cond_other <- glmer(Female ~ Condition + (1|Participant) + (1|Item),
                      data=d.noOther, family=binomial)
summary(m.cond_other)
```

```

```

Compared to the main analysis including OTHER responses, the intercept has a larger p-value, the difference between the First and Full Name conditions is no longer trending, and the Name Gender Rating is the same.

## Quadratic Name Gender Rating

The second supplementary analysis tested the effect of squared name gender rating, such that larger values meant names with stronger gender associations (masc or fem), and smaller values meant names with weaker gender associations.

```
d.FF %<>% mutate(GenderRatingSquared=GenderRatingCentered^2)
```

### Model 3: Quadratic

No quadratic effects.

```
m.namegender_squared <- glmer(Female ~ Condition*GenderRatingCentered +
                              Condition*GenderRatingSquared +
                              (1|Participant) + (1|Item),
                              d.FF, family="binomial")

## Participant Gender

### Setup/Data Summary

The third supplementary analysis looks at participant gender: if male participants show a larger bias to recall the character as MALE than non-male participants.

Participants entered their gender in a free-response box.

```
d %>% group_by(SubjGender) %>%
  summarise(total=n_distinct(Participant))
```

```
## # A tibble: 5 x 2
##   SubjGender total
##   <fct>      <int>
## 1 female      566
## 2 genderqueer  1
## 3 male        694
## 4 N/A         88
## 5 non-binary   2
```

For this analysis, we exclude participants who did not respond. Because there are not enough participants to create 3 groups, we compare male to non-male participants.

```
d.gender <- d %>% filter(SubjGender != "N/A") %>%
  mutate(SubjGenderMale=(ifelse(SubjGender=="male", 1, 0)))

d.gender %>% group_by(SubjGenderMale) %>%
  summarise(total=n_distinct(Participant))
```

```
## # A tibble: 2 x 2
##   SubjGenderMale total
##   <dbl> <int>
## 1           0    569
## 2           1    694
```

Summary of responses by condition and participant gender.

```
d.gender %<>% mutate(ResponseAll=case_when(
  Male==1 ~ "Male",
  Female==1 ~ "Female",
  Other==1 ~ "Other"))

d.gender.count_responses <- d.gender %>%
  group_by(Condition, ResponseAll, SubjGenderMale) %>%
  summarise(n=n()) %>%
  pivot_wider(names_from=c(ResponseAll),
              values_from=n) %>%
  mutate(Female_MaleOther = Female / (Male+Other),
         Female_Male = Female / Male) %>%
  rename("ParticipantGender"="SubjGenderMale")
d.gender.count_responses$ParticipantGender %<>% recode("0"="Non-male", "1"="Male")

print(d.gender.count_responses)
```

```
## # A tibble: 6 x 7
## # Groups:   Condition [3]
##   Condition ParticipantGender Female Male Other Female_MaleOther Female_Male
##   <fct>      <chr>          <int> <int> <int>          <dbl>          <dbl>
## 1 first      Non-male          684   609   30           1.07           1.12
## 2 first      Male              780   847   18           0.902          0.921
## 3 full       Non-male          595   609   49           0.904          0.977
## 4 full       Male              724   893   42           0.774          0.811
## 5 last       Non-male          170  1145   92           0.137          0.148
## 6 last       Male              210  1223  121           0.156          0.172
```

Participant gender is mean centered effects coded, comparing non-male participants to male participants.

```
d.gender$SubjGenderMale %<>% as.factor()
contrasts(d.gender$SubjGenderMale)=cbind("NM_M"=c(-.5,.5))
contrasts(d.gender$SubjGenderMale)
```

```
##   NM_M
## 0 -0.5
## 1  0.5
```

Subset First and Full conditions.

```
d.FF.gender <- d.gender %>% filter(Condition!="last")
d.FF.gender$Condition <- droplevels(d.FF.gender$Condition)
contrasts(d.FF.gender$Condition) =
  cbind("first vs full"=c(-.5,.5)) #add contrast back
contrasts(d.FF.gender$Condition)
```

```
##           first vs full
## first           -0.5
## full             0.5
```

## Model 4: Condition \* Participant Gender

Effect of Name Condition (first name, last name, full name) and Participant Gender (non-male vs male) on likelihood of a FEMALE response, as opposed to a MALE response or OTHER response. Participant and Item are again included as random intercepts.

```
m.cond_subjgender <- glmer(Female ~ Condition * SubjGenderMale +

```

- Male participants are less likely to recall the character as female overall, but this is not significant after correction for multiple comparisons.
- The interaction between Condition (Last vs. First + Full) and Participant Gender is significant.

## Interaction

Dummy code to get the Participant Gender effect just for First and Full Name conditions.

```
d.gender$FFdummy = as.numeric(d.gender$Condition)
d.gender$FFdummy[d.gender$FFdummy == 1] <- 0
d.gender$FFdummy[d.gender$FFdummy == 2] <- 0
d.gender$FFdummy[d.gender$FFdummy == 3] <- 1
with(d.gender, tapply(FFdummy, list(Condition), mean))
```

```
## first full last
##      0      0      1
```

```
m.cond_subjgender_FF <- glmer(Female ~
  FFdummy*SubjGenderMale + (1|Participant) + (1|Item),
  data=d.gender, family=binomial)
summary(m.cond_subjgender_FF)
```

- Beta for subj gender in First + Full: -0.25700
- Beta for subj gender in Last: 0.1382 NS

-> Male participants were less likely to recall the referent as female than non-male participants in the First and Full Name conditions. No participant gender difference in the Last Name condition.

## Model 5: Condition \* Name Gender \* Participant Gender

Effects of Name Condition (first name, full name), the first name's Gender Rating (centered, positive=more feminine), and Participant Gender (non-male vs. male) on the likelihood of a FEMALE response as opposed to MALE or OTHER responses. In Experiment 2, the Last Name condition does not include any instances of the gendered first name, so it is not included here.

```

```

- Male participants are less likely to recall the character as female overall. This matches the results of the interaction in the condition-only model.
- The interaction between participant gender and first name gender rating is significant. Smaller effect of name gender rating in male participants.
- Interaction with Condition, three-way interaction with Name Gender and Condition n.s.
