| Likeability | 3 |
| Accomplishment | 5 |
| Importance | 8 |

Setup

Variable names:

- Experiment: exp3
- Type
 - d = data
 - m = model
 - p = plot
 - est = log odds estimate from model
 - OR = odds ratio converted from est
- Analysis
 - Lik = likability ratings
 - Acc = accomplishment ratings
 - Imp = importance ratings

Load data and select columns used in model. See data/exp3_data_about.txt for more details.

```
8904 obs. of 10 variables:
## $ Participant : Factor w/ 1272 levels "R_020U0b05Lb0EtX3",..: 216 216 216 216 216 216 41 41 41
## $ Condition : Factor w/ 3 levels "first", "full",...: 1 1 1 1 1 1 1 1 1 1 ...
## $ GenderRating: num 5.22 1.24 5.86 3.75 6.78 4.34 2.41 6.24 2.61 6.82 ...
##
   $ Item
                : Factor w/ 63 levels "Ashley Cook",...: 6 9 13 43 47 52 62 2 16 20 ...
                : int 0 1 0 0 0 0 1 0 1 0 ...
## $ He
                : int 0010110001...
## $ She
## $ Other
                : int 1001000100...
## $ Likeable
                : int 2 2 2 2 2 1 2 2 1 2 ...
## $ Accomplished: int 2 1 1 2 1 1 2 3 1 1 ...
## $ Important
                : int 2 1 2 2 1 1 2 2 1 1 ...
```

Center gender rating for names: Original scale from 1 to 7, with 1 as most masculine and 7 as most feminine. Mean-centered with higher still as more feminine.

```
exp3_d %<>% mutate(GenderRatingCentered=
scale(GenderRating, scale=FALSE))
```

Set contrasts for name conditions, now weighted to account for uneven sample sizes. This uses Scott Fraundorf's function for weighted contrasts. (The psycholing package version doesn't support doing 2v1 comparisons, only 1v1.) Condition1 is Last vs First+Full. Condition2 is First vs Full.

```
source("centerfactor.R")
contrasts(exp3_d$Condition) <- centerfactor(
  exp3_d$Condition, c("last", "first"))
contrasts(exp3_d$Condition)</pre>
```

```
## [,1] [,2]
## first 0.4009434 -0.48113208
## full 0.4009434 0.51886792
## last -0.5990566 0.01886792
```

Flip ratings from 1=most likeable/accomplished/important to 7=most L/A/I, to make interpreting models easier, then mean-center.

```
## 'data.frame': 8904 obs. of 17 variables:

```

Does the Accomplishment rating of the character predict the likelihood of *she* as opposed to *he* and *other* responses? The maximal model includes all interactions, then random intercepts by item but not by participant.

## GndRC:AC:C2 -0.592 0.056
```

- Characters who are rated as more Accomplished are more likely to be referred to with *she*, but this is n.s. after correction for multiple comparisons.
- Interaction between Accomplishment, Name Gender Rating, and Condition (L vs F+F), but this is n.s. after correction for multiple comparisons, so I'm not going to dig into it.

Importance
